

# Sprint 1 Retrospective

## *Start Doing:*

- Work on one feature at a time as a full team, completing backend, frontend, and database integration before moving to the next feature.
- Perform testing after each feature is completed, instead of leaving testing for the end.
- Have short daily syncs aside from daily sprint meetings to make sure everyone is aligned and no two sub-teams drift in different directions.

## *Stop Doing:*

- Stop building the entire frontend and backend first and delaying the database—this creates mismatches and integration failures.
- Stop working in isolation without integration testing or communication between the groups.

## *Continue Doing:*

- Continue documenting each part, as it will help when integrating features.
- Continue collaborating in pairs, because pairing did help productivity, but ensure proper coordination across the team.
